

## Bloodborne Pathogens Exposure Control Quiz

QUESTIONS:	TRUE	FALSE
1. Anyone can potentially be infected with HBV and/or HIV.		
2. Universal precautions mean you must treat all blood and body fluids as potentially infected.		
3. HBV can be cured but there is no cure for HIV.		
4. Personal Protective Equipment can protect you against contact with blood or body fluids.		
5. After clean up, always wash your hands before eating, drinking, smoking, or applying cosmetics.		
6. A blood borne pathogen is a disease that is carried in the blood.		
7. Clean up does not require the use of a disinfectant.		
8. Administering first aid requires the use of Personal Protective Equipment before any aide is administered.		
9. Administering first aid is the only means of potential exposure to blood borne pathogens in occupations outside the medical profession.		
10. Someone you know well should not necessarily be considered as potentially infectious.		
11. HBV can infect the liver.		
12. A person infected with a blood borne pathogen will immediately show symptoms of infection.		
13. An exposure incident should be reported only if you later become infected or become ill.		
14. Follow-up to an exposure incident includes medical evaluation and treatment.
